Athena

Academy Learning Management System Theme

Academy-LMS Theme Settings

Theme Settings Contents:

1. Academy-LMS theme introduction
   a. Academy-LMS now supports multiple themes for frontend. Academy lms now comes with a basic theme named 'Default'. After you install a new theme, you will find it inside Admin panel > Settings > Theme settings option. When you have multiple themes installed, you can activate any of them according to your preference. Configure course and site content based on theme configuration. Your chosen theme will be reflected immediately in the frontend website.
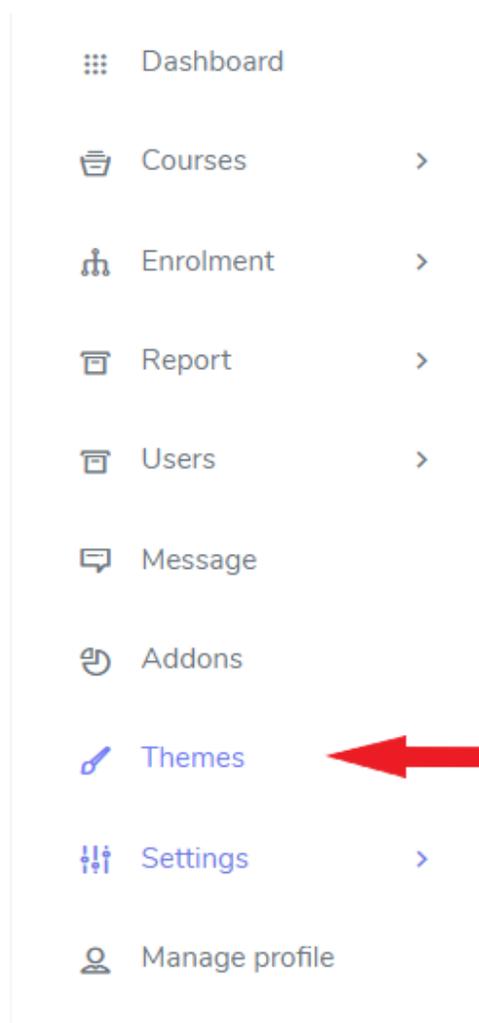

See the screenshot for better understanding.

2. Getting themes from marketplace.
   a. You can get the themes from our Codecanyon portfolio. The link is given here portfolio.

3. Installing a theme.

   a. After having a theme, it's time to install it. Please follow the steps carefully for installing a theme.

   i. Unzip the compressed theme file, which you have downloaded from Codecanyon.
   ii. You will get two folder with it. One is Theme and the other is Documentation. Inside the Documentation folder you will find multiple documentation files regarding theme settings. As you guessed it right, Inside the Theme folder there is a compressed theme file with theme name. For example, if you have downloaded the Athena theme from codecanyon the theme file name would be athena.zip. You do not need to rename it. Keep that as it is.
   iii. Copy the zipped theme file and open your hosted application's theme folder. Which is located at your application's root folder. Paste the zipped theme file there. All the installable theme files will be read from theme folder.
   iv. If you have pasted the theme file successfully, your theme is now eligible for being activated. Move to Settings > Theme Settings after logged in as Admin. You should get a Green banner on the top of Theme Settings option which will show the Theme name which you have downloaded with an Install button.

v. Click the Install button, it will take a couple of seconds for being installed. After successfully installing you will be notified with an alert.

This is the view after moving the compressed theme file inside the "themes" folder. You will have this install button for installing the theme.

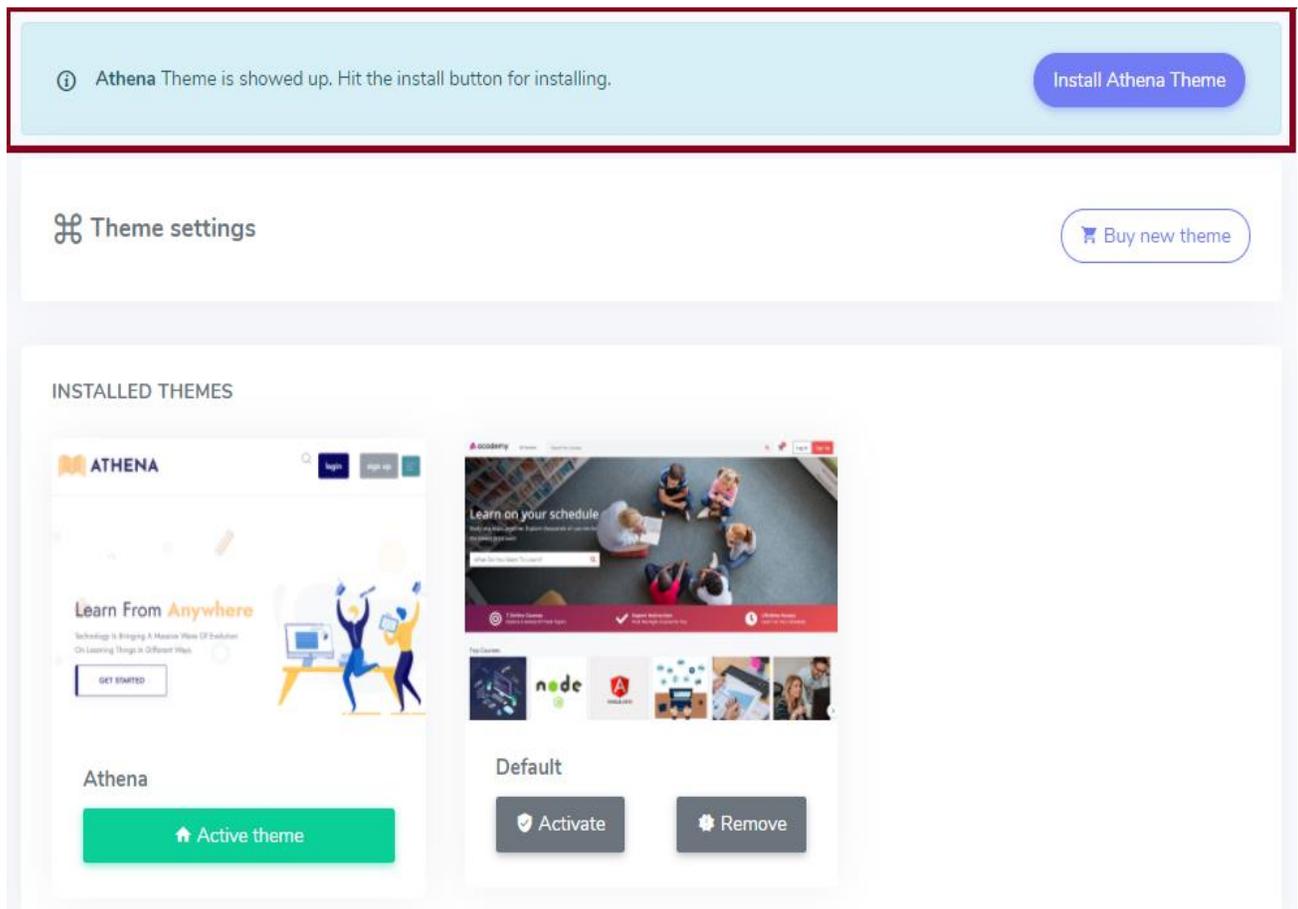

You will see this view after installing a theme successfully. You will get the new installed theme beside the default theme.
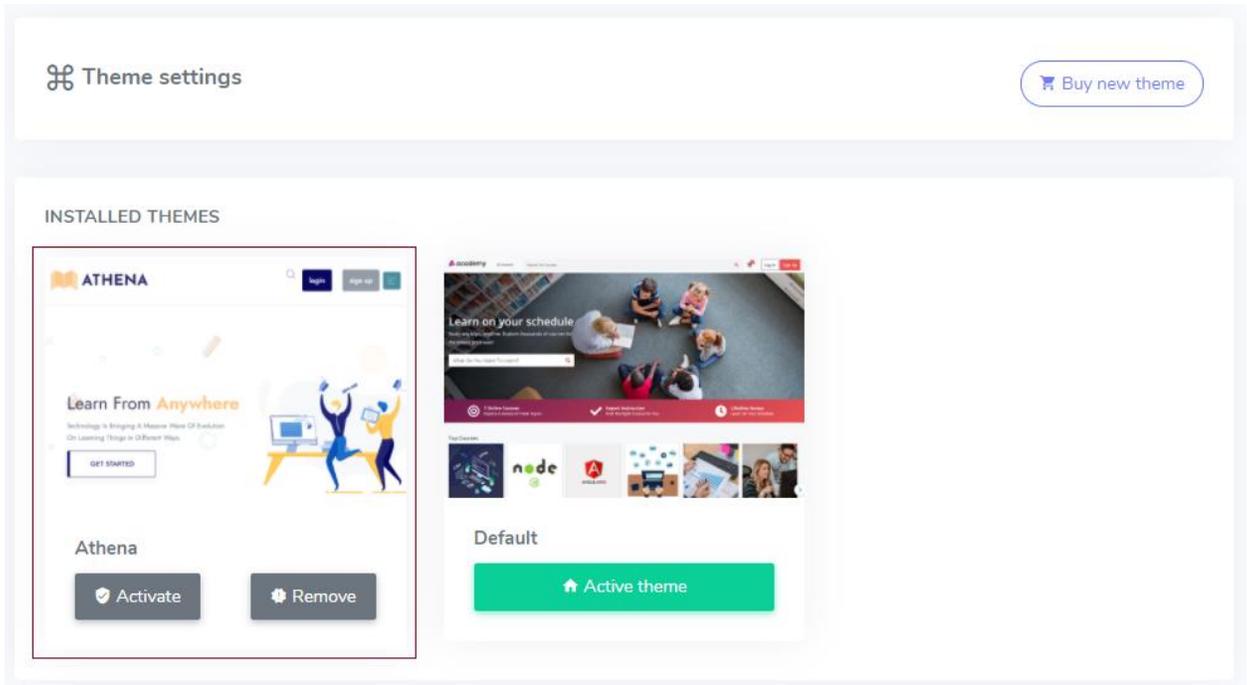

4. **Switching between themes.**

   a. If you have installed any themes successfully, you should get a preview image of the theme with two buttons on it. Among two buttons you can click on the Activate button for activating the theme and you can also click on the Remove button for removing the theme.

   See the screenshot below for visualizing the theme switching process.
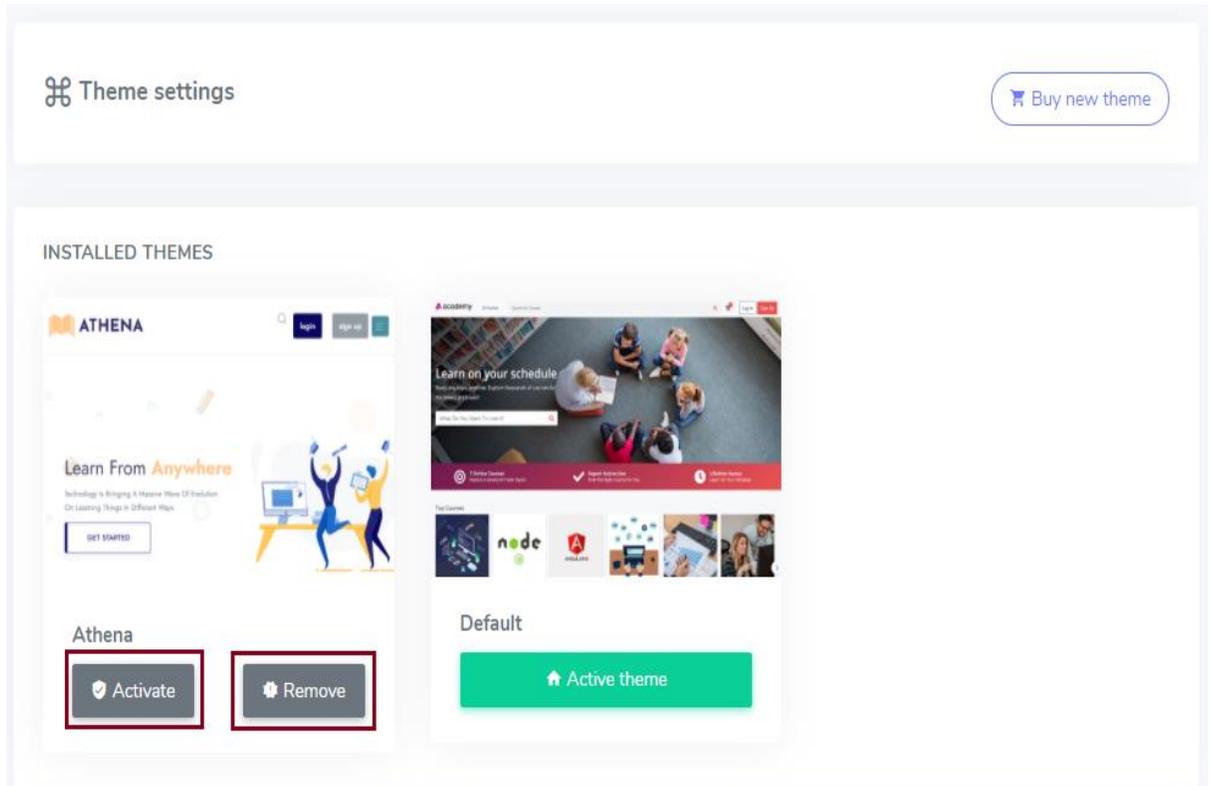

5. Theme wise media content management.
   a. What we meant by Media content management is, the representation of images, icons and their sizes. Every theme's media representation, and sizes are non-identical. For example, If you are running the "Default" theme with Academy-LMS and suddenly want to switch it to "Athena". Default theme requires single image for creating a course, and also Athena theme requires single image. So, you need to upload the image for better experience.

6. Theme files structure.

    a. We have sorted out the theme files in two different folders.

        i.   Assets - Inside the assets folder we've kept all the required styles and javascript files as zipped.

        ii.   ii. Views - Inside the views folder we've kept a zipped file which has all the views for a specific theme. Theme's assets file structure is showing below
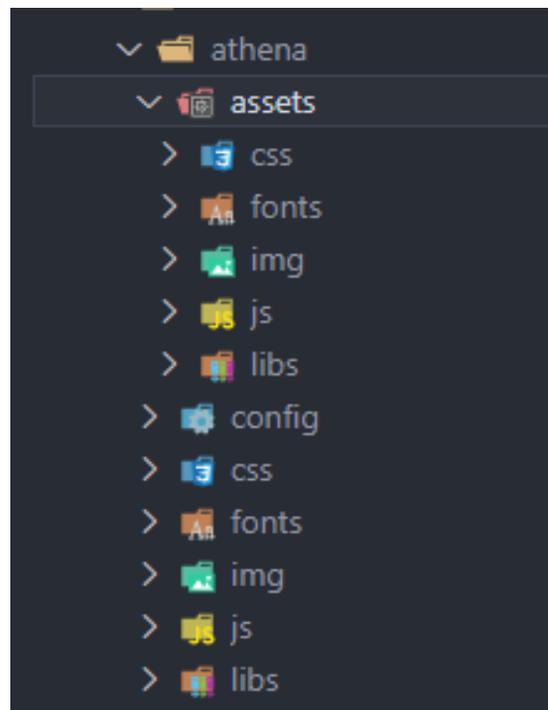

Theme's views file structure is showing below.
